01 / NOMAÉ

Designing a complete fashion shopping experience

From a full Figma design to a live e-commerce prototype

I created NOMAÉ from the ground up: a minimalist fashion store with a complete shopping experience. I designed every screen in Figma, then used Codex to turn the design into a functioning web prototype.

The live implementation of my design.

My role

End-to-end UI design in Figma, UX decisions and shopping flows, design direction, implementation with Codex, and publication through GitHub and Vercel.

Explore NOMAÉ: nomae-store.vercel.app

02 / CONCEPT AND GOALS

A considered wardrobe, a clear shopping experience

Independent UI/UX project

The concept

I created NOMAÉ as a contemporary fashion e-commerce concept focused on curated, minimalist clothing. I wanted the interface to reflect that aesthetic while supporting the practical decisions involved in buying clothing online.

The design challenge

How could I carry a calm, editorial visual direction through a complete shopping journey, while giving shoppers clear navigation, product information, selection controls and checkout guidance?

Intended audience

People who shop for minimalist clothing online and value curated pieces, straightforward browsing and clear information. I used this audience definition as a design starting point rather than a research-derived persona.

Experience goals

Make discovery easy. Support product comparison. Keep size and option selection explicit. Show the chosen items and costs through checkout. Give each step a clear next action.

Primary shopping task

Find a suitable garment, evaluate the details, choose a size, review the bag, enter contact and address information, compare delivery options, and complete the demo checkout.

Project boundaries

This is a portfolio concept with simulated checkout. I did not conduct participant research or measure business outcomes. I designed the entire project in Figma before implementing it with Codex.

03 / DESIGN SCOPE

Designing beyond the homepage

I designed the full project in Figma, not just the final UX updates.

Discovery and browsing

Homepage, curated collections, catalog and product categories, search entry, filtering and sorting.

Product evaluation

Product details, imagery and zoom, price information, size and color selection, product information tabs and related pieces.

Saved items and shopping bag

Wishlist entry points, bag review, item options, quantity controls and removal.

Purchase journey

Contact and address information, shipping choices, payment method selection, order summary and demo completion.

Supporting experiences

Sign-up, sign-in, password recovery, help, FAQs, delivery and returns information, brand content and the journal.

From design to implementation

I established the visual direction and screens in Figma, used Codex to implement the experience, reviewed the local prototype, and published approved work through GitHub and Vercel. The later audit helped refine an already complete design.

Screens in this case study show the live implementation of my Figma design. Original Figma frames and early explorations are not reproduced here.

04 / INFORMATION ARCHITECTURE

Organizing the store around tasks

A documented structure for the complete shopping experience

Discover

Home introduces the brand and featured pieces. Catalog and collections give shoppers routes into the clothing range. Search provides a direct entry for people with an item in mind.

Evaluate

Product details bring imagery, price, styling details, size choices and supporting information together before the shopper adds an item.

Purchase

The bag reviews selected items. Checkout separates information, shipping and payment, keeping the order summary visible. Confirmation explains the end of the demo.

Save and return

Wishlist provides a place to keep pieces for later. Join NOMAÉ and Create account lead into sign-up; returning shoppers can sign in or open password recovery. Back to shopping reconnects these paths with the store. Guest checkout remains available.

Find support

Sizing, delivery, returns, FAQs and contact information support shopping decisions. About and journal content extend the brand experience.

STRUCTURAL PRINCIPLE

I prioritized the shopping task while keeping account, support and editorial content accessible. Information should be available where it helps a decision, rather than requiring an unnecessary detour.

05 / SHOPPING JOURNEY

The decisions behind the screens

A task-based journey model documenting the intended experience, not participant findings.

STAGE	SHOPPER GOAL	DESIGN RESPONSE
Discover	Understand the store and begin shopping.	Editorial hero + catalog entry.
Browse	Narrow the collection to relevant pieces.	Categories, filters and sorting.
Evaluate	Judge appearance, fit and suitability.	Product imagery + product information.
Choose	Select options and add the garment.	Explicit size selection + feedback.
Review bag	Check the item and quantity.	Image, options, price and editing controls.
Checkout	Enter details and compare delivery.	Step indicator + persistent summary.
Complete	Understand the outcome and next action.	Clear demo confirmation.

The purchase journey is one of several connected paths. Account creation, sign-in, password recovery, saved items and support extend the experience before and after checkout. I mapped these paths on the following pages.

06 / ACCOUNT JOURNEY

Join, return and recover access

The account path connects with browsing without becoming a required step for guest checkout.

I designed account creation and returning-user access as part of the complete store. Shoppers can enter through the header account icon, footer links or the homepage Join NOMAÉ invitation.

PATH	SHOPPER ACTION	DESIGN RESPONSE
Join	New shopper chooses Join NOMAÉ or Create account.	Open the sign-up screen.
Create account	Enter first name, last name and email; create and confirm a password.	Visible labels, password visibility controls and one primary action.
Alternative entry	Choose Continue with Google.	A distinct alternative to the email form.
Return	Existing shopper switches to Sign in.	Email, password, Remember me and a sign-up link.
Recover	Choose Forgot password? and enter an email.	Reset-link request and Back to sign in.
Resume shopping	Choose Back to shopping.	Return to product discovery and the purchase path.

Keep account and purchase paths connected

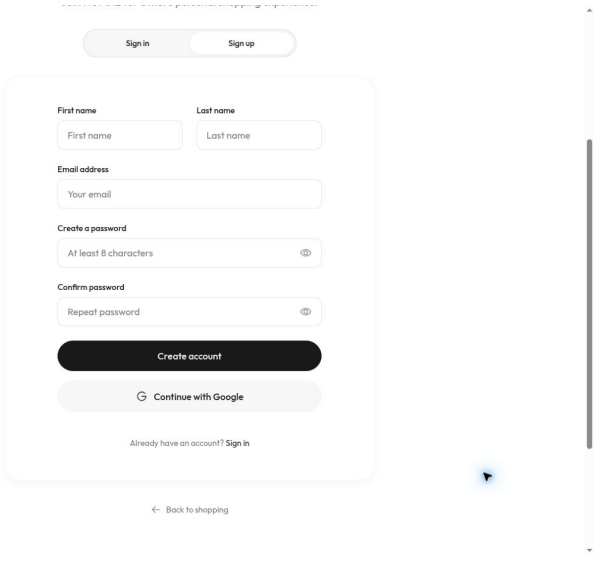

I provided direct links between sign-up and sign-in, a recovery route for returning shoppers and a way back to the store. Account access is available when needed; browsing and guest checkout can continue independently.

07 / ACCOUNT SCREENS

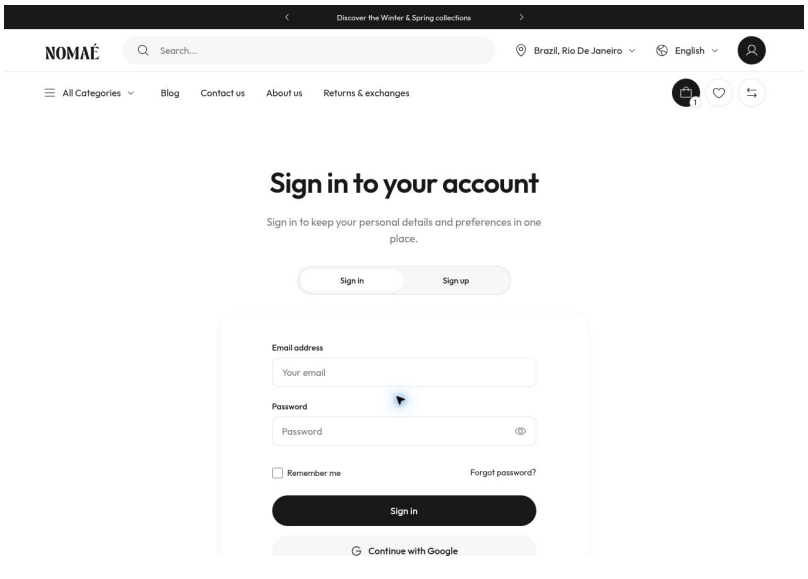

A familiar system for account access

Sign-up and sign-in follow the same visual language as the shopping experience.

SIGN-UP

SIGN-IN

Clear entry and switching

I used a shared card layout and a Sign in / Sign up switch so the two account states feel connected. A short heading explains the purpose of each screen.

Explicit fields and controls

Sign-up gathers name, email, password and confirmation. Sign-in uses email and password with Remember me. Password visibility controls support checking an entry before submission.

Recovery and continuation

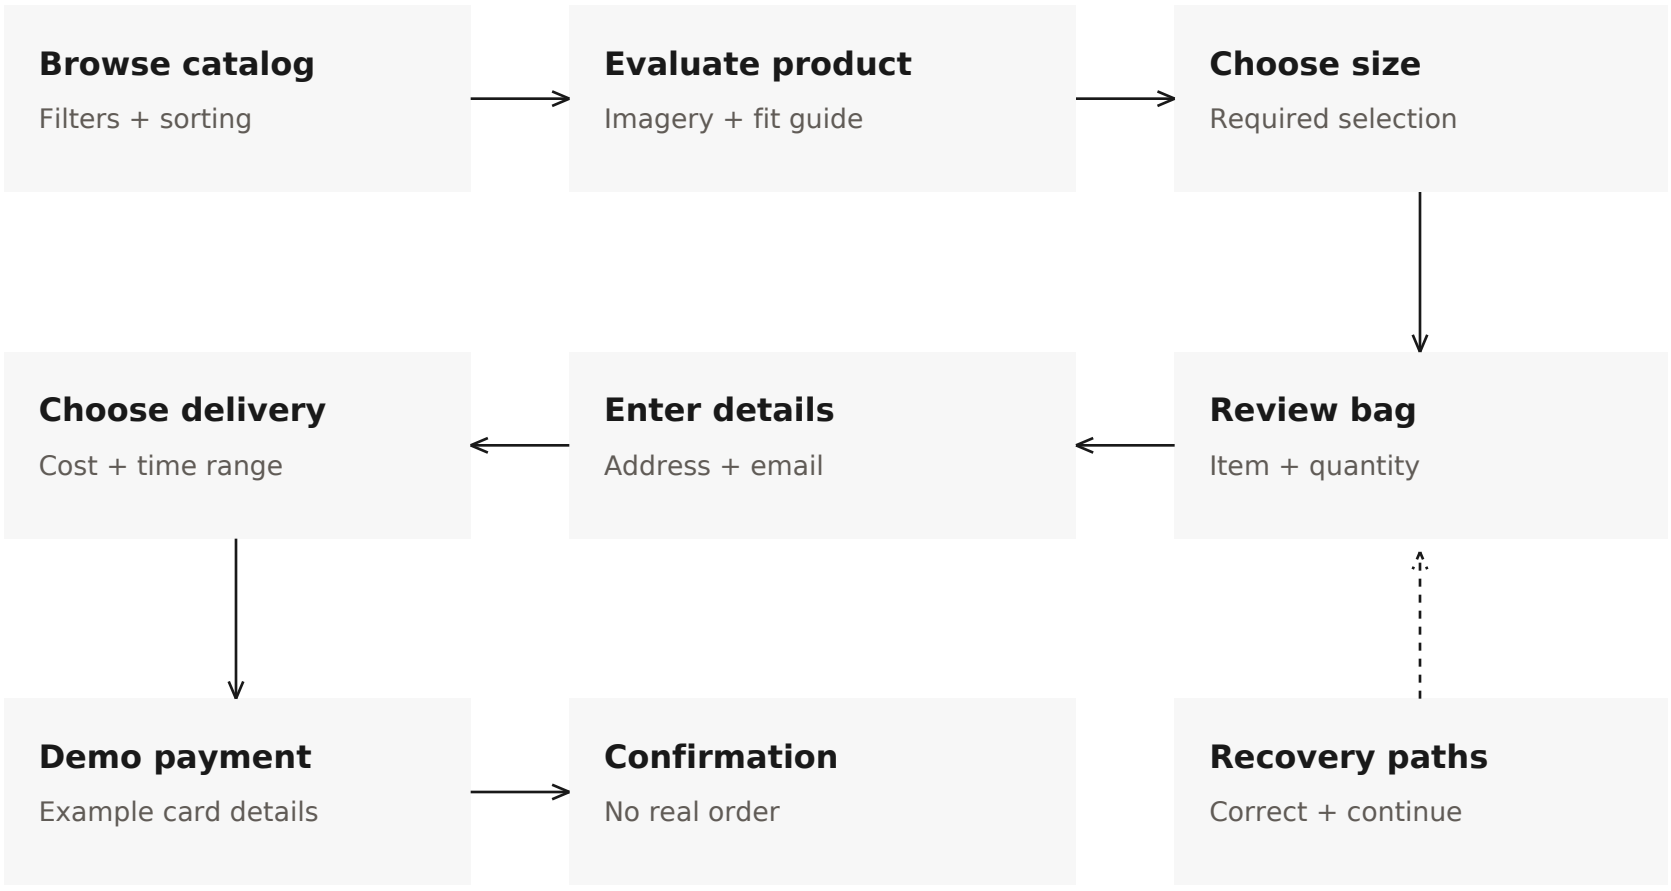

Forgot password opens the email-based reset request. Back to sign in closes that recovery loop, while Back to shopping lets users continue exploring the collection.

Interface review covered these screens and navigation. Account submission, Google authentication, reset-email delivery and authenticated account states still need separate end-to-end verification.

08 / INTERACTION FLOW

Design for progress and recovery

I documented the purchase path and the ways shoppers can revisit their choices.

Size not selected

Add to bag remains disabled; the prompt asks the shopper to choose a size. The size guide provides a route to supporting information.

Details or delivery need correcting

Edit address and previous checkout steps allow revisiting earlier decisions. Shipping selection recalculates the visible summary before payment.

Remaining recovery work

Persistent inline form errors, payment-error states and the clarity of the completion recap remain improvement opportunities. Full keyboard and screen-reader behavior still need verification.

09 / DESIGN SYSTEM - FOUNDATIONS

A restrained visual language

I built a consistent visual system to support NOMAÉ’s minimalist shopping experience.

COLOR TOKENS

Primary + text

#191919

Actions + main text

Background

#FFFFFF

Page + controls

Surface

#F7F7F7

Quiet backgrounds

Stroke

#191919 / 10%

Subtle separation

Typography / Outfit

I used Outfit throughout the interface. Verified desktop styles: hero heading 64 px / 600; catalog heading 36 px / 500; body copy 16 px / 400; primary CTA 16 px / 500; size labels 13 px. The wordmark uses a distinct serif treatment.

Typography hierarchy

Headings establish hierarchy, prices support comparison and labels guide input. Primary copy uses #191919; secondary catalog copy uses #191919 at 60% opacity. White text sits on the dark primary CTA and over the hero image.

Surfaces and imagery

White pages and #F7F7F7 surfaces give the clothing room to stand out. The filter panel has a 20 px radius. The primary CTA and size controls use a 40 px radius. Neutral product imagery supports comparison; editorial photography establishes the homepage mood.

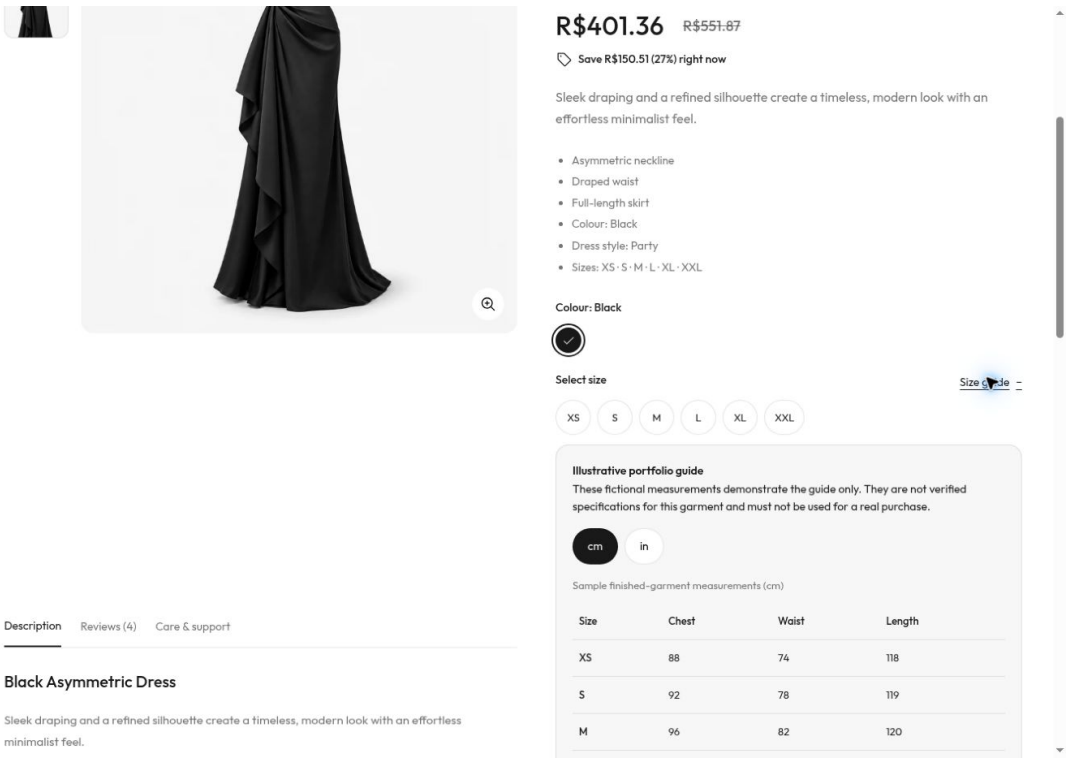

Interaction clarity

I use subtle strokes to separate content and stronger visual states for selected controls. Clear focus indicators, field boundaries and readable text remain priorities for accessibility checks.

10 / DESIGN SYSTEM - COMPONENTS

Consistent patterns, clear states

I reused familiar components to keep interactions consistent throughout the store.

Live product screen: size controls, guide disclosure and a measurement table.

Actions

Filled primary purchase buttons; quieter text links for supporting information. Add to bag is disabled until a size is selected.

Selection

Circular size options, color swatches and unit toggles use visible selected states. Shipping uses mutually exclusive radio choices.

Product cards

A recurring image, product name, price, wishlist action and bag action support comparison across the catalog.

Forms and feedback

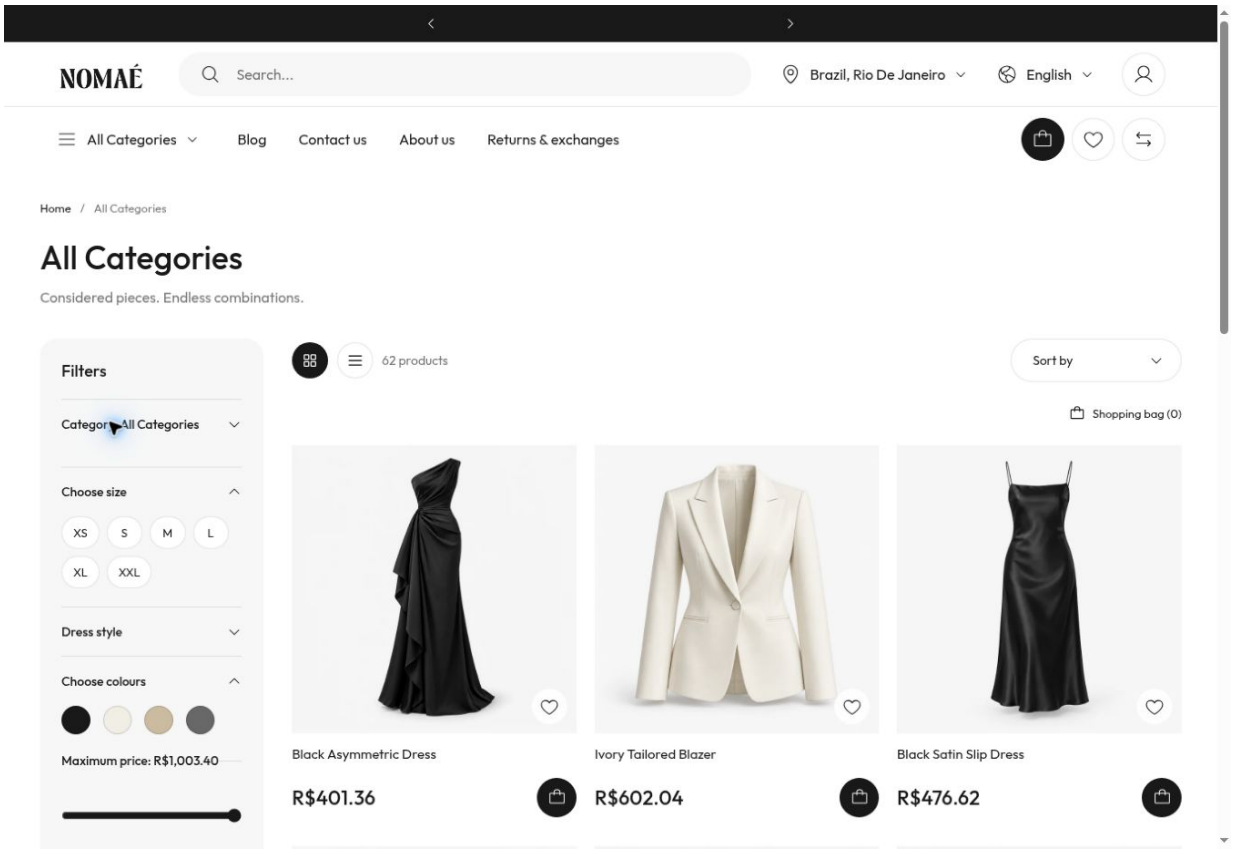

Visible field labels, a step indicator and a persistent order summary support checkout. Add-to-bag feedback confirms the action; validation and focus behavior need deeper checks.

I kept labels, selection treatments and feedback consistent across similar tasks, creating a recognizable experience from browsing to checkout.

11 / DISCOVERY AND BROWSING

Balancing editorial identity with product discovery

Core design decisions across the homepage and catalog

Catalog: a consistent comparison layout with filters and sorting.

A clear visual hierarchy

Large editorial photography introduces the brand; a recurring image, name and price hierarchy supports practical browsing in the catalog.

Controls for different intentions

Categories and filters help shoppers narrow the range. Sorting changes how pieces are ordered. Search supports a more direct shopping intention.

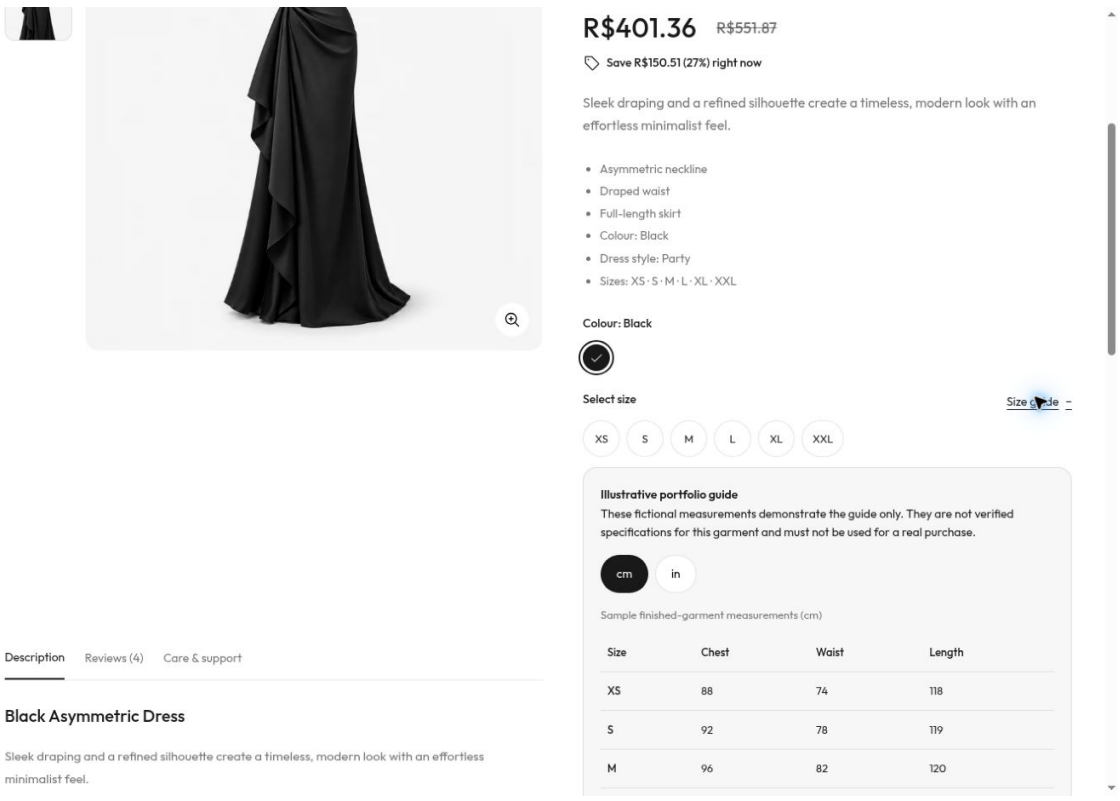

Consistent product presentation

Neutral imagery backgrounds and repeated card patterns help keep attention on the clothing. Wishlist and bag actions are available within the browsing experience.

12 / PRODUCT EVALUATION

Make the garment the center of the decision

Product details and selection states

Product details: garment imagery, size choices and fit support.

Show the product clearly

I paired prominent garment imagery with price, description and design details. Detail views and zoom offer additional ways to inspect the item.

Make choices explicit

Size and color controls show available options. Add to bag remains disabled until a size is chosen, and confirmation feedback acknowledges the completed action.

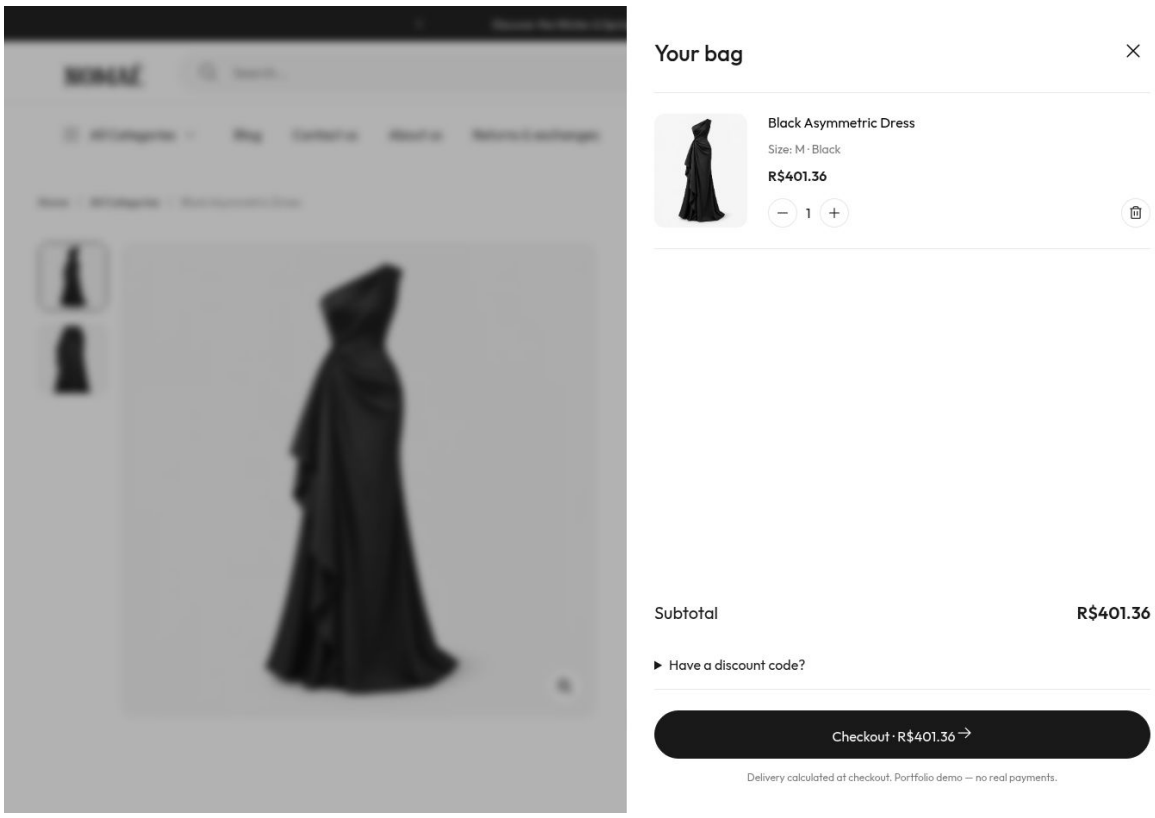

Keep supporting information available

Tabs and related pieces extend product evaluation. The later size-guide refinement adds sample measurements and fit guidance beside the size choice.

13 / BAG AND CHECKOUT

Carry decisions through to completion

A complete simulated purchase journey

Bag: item review, selected options and quantity controls.

Review before continuing

The bag keeps the item image, name, size, color, price and quantity together. Editing controls allow revising the selection before checkout.

Break checkout into clear stages

Information, shipping and payment give the purchase path an understandable structure. An order summary carries the selected item and totals through the flow.

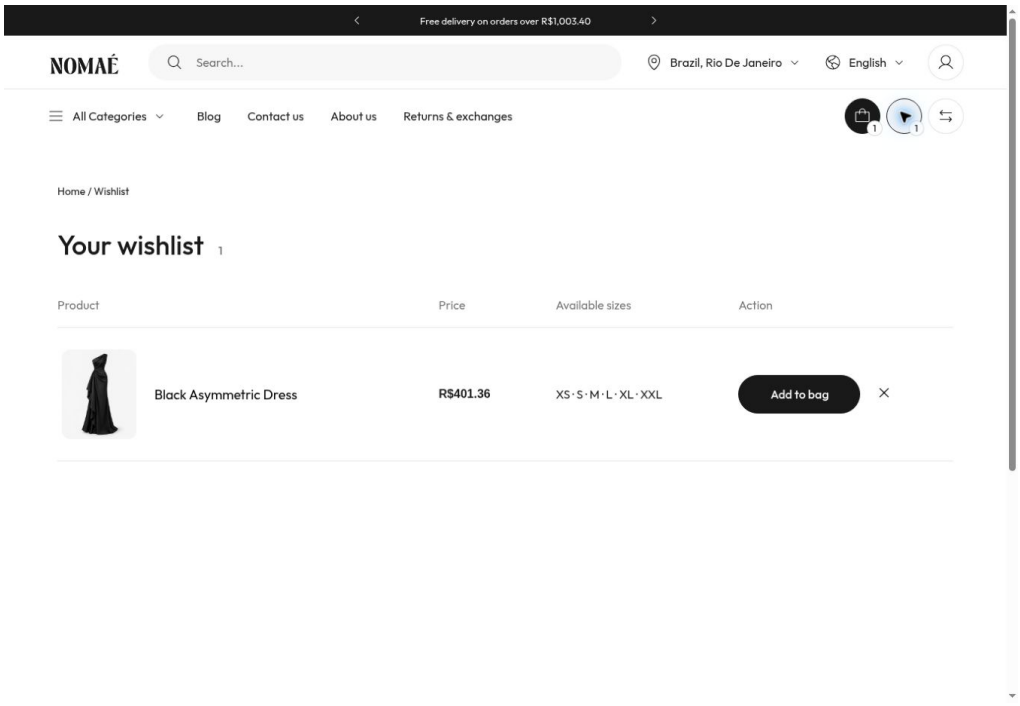

Show the result accurately

The demo ends with a clear confirmation that no real order or payment occurred. A richer recap, cost estimates and field-level error recovery remain opportunities for future refinement.

14 / SAVED ITEMS AND SUPPORT

Return to favourites, find help when needed

The journey extends beyond a single purchase attempt.

Wishlist: saved garment, price, sizes and the next shopping action.

Save and revisit

I placed heart controls on product cards. The wishlist collects saved pieces with imagery, prices and available sizes, plus Add to bag and removal actions. An empty wishlist explains how to save and links back to the collection.

Reconnect with the purchase path

A saved piece can be reopened for evaluation or taken toward the bag. The saved state and wishlist count provide feedback as the shopper moves between the catalog and saved items.

Support before and after purchase

FAQs, delivery and contact routes help answer shopping questions. Returns & exchanges offers an order-number and shipping-postal-code form with a Start a return or exchange action, creating a support entry after purchase.

15 / TOOLS AND WORKFLOW

From Figma to a live product

I connected design, implementation, version control and deployment in one iterative workflow.

Figma
Design

Codex
Implementation

GitHub
Version control

Vercel
Deployment

01 / Design in Figma

I developed the visual direction and UI in Figma, establishing the palette, Outfit typography and shopping screens as the basis for implementation.

02 / Build and refine with Codex

I used Codex to implement the design and make updates step by step. I reviewed changes in a local preview before approving publication.

03 / Save the project in GitHub

I connected the project to GitHub and pushed approved code to the main branch. Version control keeps a history of the project as I make updates.

04 / Deploy with Vercel

I imported the GitHub repository into Vercel to publish the store. Approved code updates were pushed to GitHub for deployment to the live app.

05 / Review the live experience

I used the deployed product as V1 for the UX audit, prioritized improvements, then repeated the local-review and publish cycle. The refined desktop flow was checked through demo confirmation.

Live app: nomae-store.vercel.app

Tool marks identify the products used. Figma and GitHub marks belong to their respective owners. Vercel and related marks are trademarks of Vercel, Inc. or its affiliates.

16 / REVIEW AND REFINEMENT

Refining the complete experience

The post-launch audit was one stage of the project, not its starting point.

After designing and implementing NOMAÉ, I reviewed the live V1 shopping flow. The review highlighted three focused ways to improve information and navigation without changing the visual direction.

Shopping entry

Before: Shop Now opened one featured dress.
Refinement: the general CTA now opens the catalog.

Size support

Before: size options lacked a nearby measurement guide.
Refinement: an expandable guide adds illustrative measurements, units and fit notes.

Delivery clarity

Before: Standard and Express showed prices without arrival ranges.
Refinement: both options show illustrative timing alongside their cost.

Functional verification

The live desktop review confirmed the catalog destination, size-guide expansion and unit switching. Selecting Express updated the total, and the simulated card flow reached confirmation.

Why these refinements matter

They bring information closer to the shopper’s next decision: where to browse, how to compare sizes and how to choose between delivery options. Their impact on actual shoppers has not been measured.

17 / OUTCOME AND REFLECTION

From initial idea to a functioning product

A full design project, implemented and published

What I delivered

I designed the full NOMAÉ project in Figma, established the visual system and core shopping interactions, implemented it with Codex, and published a live prototype through GitHub and Vercel.

What I learned

A consistent visual language needs equally clear interaction rules. The catalog, product page, bag and checkout each support different decisions, so information and feedback need to stay coherent across the entire journey.

The role of iteration

The initial design gave the project its complete structure and visual identity. Reviewing the implemented product then helped me refine discovery, fit support and delivery information. The result is both a design portfolio project and an experience that can be explored live.

Future work

Test the shopping tasks with real participants. Verify mobile reflow, keyboard access, screen-reader announcements and contrast. Refine cost estimates, inline error handling and the completion recap.

Method and evidence

I reviewed the desktop purchase flow, wishlist saving and account-screen navigation. Account creation, Google authentication, reset-email delivery and return submission still need verification. No participant research or conversion measurement was conducted. Measurements and delivery timing are illustrative. Screens show the live implementation of my Figma design.

Tools and credits

I used Figma for the complete design, Codex for implementation and iteration, GitHub for version control and Vercel for publication. AI also supported the expert review and case study preparation.
